

# PROTECT YOUR INVESTMENT WITH LIFELINE.®

You have just one chance to start your newborns right. Count on LIFELINE nutrition products for young production animals—formulated with the power of functional proteins—to deliver the *very best nutrition* to every animal.

Our functional proteins are *proven* to help combat the effects of stress and to help support and maintain normal immune function. They’re the most consistent, high-quality source of globulin protein available and have been given to animals around the world for more than 30 years with proven beneficial effects.

When you use LIFELINE the return on investment will be clear. You’ll see a rapid response in your animals. You’ll have greater peace of mind. And most important—your animals will *thrive*.

- 150g 150 grams of globulin protein
- 15% 15% fat guarantee plus added carbohydrates
- Feed in place of colostrum

## WHAT ARE FUNCTIONAL PROTEINS?

LIFELINE functional proteins are derived from natural bovine plasma, which contains components similar to those found in milk and colostrum. Through a proprietary process, specific proteins in the plasma are isolated and preserved in a concentrated serum, which is spray-dried for inclusion in LIFELINE animal nutrition products.

When you have a lot of newborn calves to feed.

**NOURISH ADDITIONAL SIZE OFFERING: 27.5 lb BAG**

**RESCUE ADDITIONAL SIZE OFFERING: 30 lb BAG**

WHEN TO USE LIFELINE CALF NUTRITION PRODUCTS

SCENARIO	REASON	PROVIDE
Calves of first-calf heifers, twins or abandoned calves	First-calf heifers typically have low-quality colostrum. Twins or abandoned calves won't receive enough/any colostrum unless you step in.	1 feeding of <b>Nourish</b> or <b>Rescue</b> to provide the nutrition needed for newborns.
Calves born in harsh conditions	Calves born in the extreme cold or other harsh conditions need extra nutritional help to get up and suckle on their own.	1 feeding of <b>Protect</b> if you know the calf has received some colostrum OR 1 feeding of <b>Nourish</b> or <b>Rescue</b> if you haven't seen the calf stand or you're not sure it has received colostrum.
Calves born in challenging situations	A calf that spends too much time in the birth canal, has a generally difficult birth, or is born into a challenging environment needs extra nutritional support.	1 feeding of <b>Protect</b> 8 hours after the first feeding of mom's colostrum OR 1 feeding of <b>Nourish</b> or <b>Rescue</b> as soon as possible after birth to ensure the calf receives the highest-quality nutrition.
Calves purchased at sale barns	These calves have an unknown health status and have experienced being removed from mom, transported to the sale and co-mingled with calves not from their farm.	1 feeding of <b>Protect</b> as soon as the calf gets to its new home, plus follow up with 1 carton of <b>Intervene</b> , fed twice daily for 5 days, to help maintain normal intestinal health.
High-value calves (registered herds, embryo transfer, show animals)	To know with certainty that the calf will receive high-quality Day One nutrition, protect your important investment.	1 feeding of <b>Nourish</b> or <b>Rescue</b> as soon as possible after birth, plus 1 feeding of <b>Protect</b> 8-12 hours later.
Calves experiencing challenges that require extra support	These calves can go downhill fast. If they don't receive nutritional support quickly, they often turn into hard keepers that cost you money, or worse, they don't survive.	For 1 calf, feed 1 packet of <b>Intervene</b> twice daily for 5 days to help maintain normal intestinal health. If you have a lot of young calves, feed 1 oz of <b>Gammulin</b> twice daily for 2 weeks.

# THE LIFELINE PROMISE

Our promise is to deliver innovative products that are easy to use, highly palatable and provide a quick visual response. It's that simple. Because we know you care about your animals and we – just like you – want to see them healthy and *thriving*.
